

Reasons to “Go Solar”

Reduce your environmental footprint

- Green House Gasses (GHG) are contributing to global climate change that have drastic implications.
- Solar Thermal systems are the best renewable energy method to significantly reduce your GHG emissions; a two-panel system has the same benefit as buying a hybrid car.
- Save the equivalent of 1.2 acres of carbon-absorbing forest for every Simple Solar panel installed.
- Every three-panel system installed is the equivalent to taking one car off the road.

Promote the renewable energy industry

- The renewable energy industry is leading to a sustainable society for our children and future generations.
- Create local jobs in the design, installation and servicing of renewable energy systems.
- Reduce combustion of fossil fuels that are being used at a rapid rate, driving more exploration and extraction, at increasing environmental costs.

Stop supporting the current energy system

- Using energy from the grid perpetuates the current energy structures. As our population grows, this dependence demands more big-government / big-utility expansion projects that consume vast amounts of resources and large tracts of land.
- Avoid the crisis caused by ‘the grid’ being out due to weather, over-demand or operating failures.

Be Financially Wise

- Save on your monthly utility bills.
- Avoid increasing utility costs that have risen at 3 times inflation for the past decade.
- Realize there is no payback on your current utility bill so why not invest in an alternative that does provide a payback?

Be a leader

- Become part of the solution to Climate Change, not part of the problem.
- Break away from the crowd being led by the large utility companies.
- Set an example for your family, friends and neighbours and encourage them to follow your ‘green’ lead.
