

Water Grabber Bull Dog™

High Volume Sump Pumps

Basement Technologies is proud to introduce our revolutionary new Water Grabber – the “Bull Dog”! Our unique patent pending sump pump system represents an innovative alternative to the basement waterproofing industry. Basement Technologies’ research and development department continues to “think outside the box” or in this case “Inside the Box” and as a result…the new Water Grabber “Bull Dog”!

High Volume Sump Pumps

Basement Technologies is proud to introduce our revolutionary new Water Grabber® – the “Bull Dog”! Our unique patent pending sump pump system represents an innovative alternative in the basement waterproofing industry. Basement Technologies’ research and development department continues to “think outside the box” or in this case “Inside the Box” and as a result…the new Water Grabber® “Bull Dog”!

Why would we call our revolutionary new product the “Bull Dog”?

…because that’s exactly what it is! The Bull Dog breed combines characteristics like tenacity, loyalty and toughness…all of which define our new sump pump configurations with backups and secondary pumps…all of which can be accomplished without changing liners or having any ugly “buckets”.

Most of you are familiar with the old circular design that other waterproofing companies are content to use. Once again, Basement Technologies has proven that to be a leader in the business, one must continually improve old products and introduce more efficient new ones.

The circular pump liner that other waterproofing companies continue to use is simply not aesthetically pleasing and effective…Our answer to this out-of-style look and function is the “Bull Dog”.

Your basement was built level, plumb and square – not circular. Historically, a sump pump is located on a straight wall or in a corner. Doesn’t it make sense to install a sump pump that fits snugly and attractively in your basement and emulates the building product look? – not a sump pump look!

The most effective waterproofing systems are installed on the inside of the home. When the interior drainage systems are installed, they need a central ejection device—a way to get the water to the outside of the home. Our patent pending Water Grabber® Bull Dog” is the heart and lungs of our Water Trek Aqua Route® perimeter system. The Water Grabber Bull Dog consists of a patent pending drilled polyethylene basin with a split lid. We use 3/4" gravel to surround the basin to help filter the water.

We install our alarm, The Grabber Pal II, in the basin to alert you if the pump has a mechanical problem or was unplugged accidentally, which can cause a flood. This alarm is float activated and far superior to sensor type alarms which other companies carry. We use a special rubber fitting called “The Silencer” over or under the lid dependent on a side discharge or top discharge to hush the already quiet pump.

There are none like it in the basement waterproofing industry and no other basement waterproofing company can offer a sump liner like it!
